Prototype Report - CMPS 115
OnCareer
Members: Steven Suh, Drew Caltagirone, Jeff Yang, Kyle Batross, Swapnil Patil, Tony Dang

List of Known Bugs:

- If Google API does not load in time that the Calendar is being display, there will be an error thrown regarding the length of an itemRequest/ item. This is caused because Google API does not load to define that length.
- The Google Sign-in button on Landing Page has an asynchronous issue where the Sign-in button takes some time to update the message from "Sign in with Google" to "Redirect to App".
- When clicking on the agenda page in the calendar, events are not always being displayed correctly.
- On the heroku website, when you refresh the page sometimes 'Not Found' occurs.
- Clicking a calendar event to edit often does not edit the event, but sets up a new event. Hard to click on event to edit.
- On the heroku website, when you log on, sometimes you might have to refresh in order to see the site load, most commonly the Dashboard.
- There is an issue with Calendar where if you try to add a whole-day event, the app crashes.
